Introducing Brooklyn

In this report, I will be telling you all about **Brooklyn the Basking shark** (*Cetorhinus maximus*), and her journey along the eastern shore of the United States of America. During her journey through the Atlantic Ocean, Brooklyn used her **gill rakers** to feed on phytoplankton and small crustaceans within the water column.

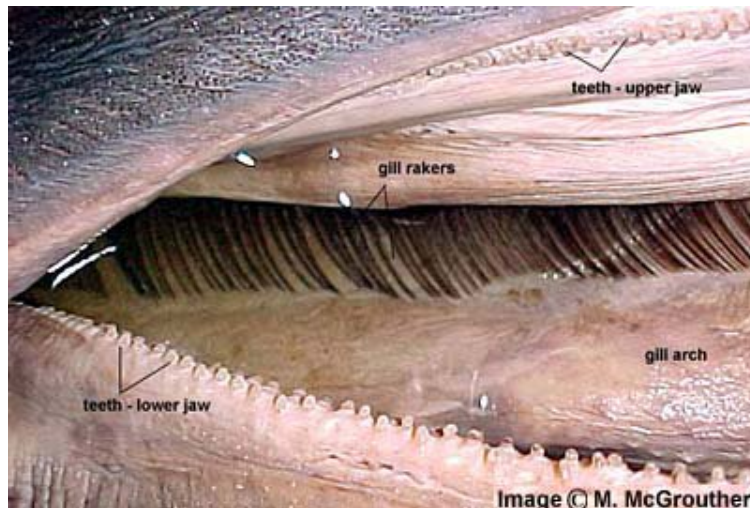

Selfie!

Brooklyn sent me this selfie while on her journey through the Atlantic Ocean

Gill Rakers

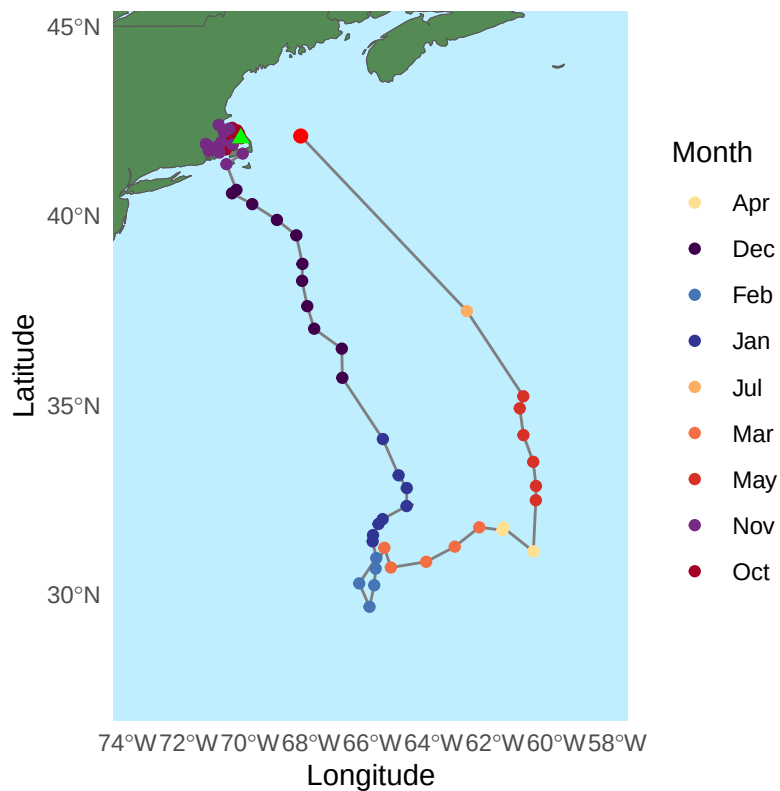

Look at all those gill rakers!

Post-Swim Review

After all that swimming, Brooklyn deserves to be recognized for her hard work! Here is the official **break-down**

Drumroll please. . . .

Brooklyn's Journey Summary

Starting Location	(-70.2943, 42.0470)
Ending Location	(-68.3400, 42.1050)
Latitudinal Change	12.7214
Total Distance Traveled	2692393km
Maximum Depth	1.08km

Wow!!! From Oct 11, 2008 to Oct 1, 2009, Brooklyn traveled over 2 million km! That is over 4 million times the height of the CN Tower. To fuel her mission, she likely had to eat a lot of phytoplankton. On average, basking sharks filter around 2000 tons of water each day, so over the course of Brooklyn's journey, she could have filtered over 710000 tons of water.

Great job Brooklyn!
